

ABSTRACT

An object is to provide an imaging apparatus which can
change a frame rate and so on as intended during photographing
5 and improve operability for image creation. The imaging
apparatus comprises an automatic switch setting section for
storing frame modes, the set values of photographing parameters,
and the set times of the parameters. According to an operation
state of an operation switch, a system control section
10 automatically switches the frame modes and the photographing
parameters based on the data of the automatic switch setting
section.
